Mr. Paul A. Giardina
Radiation Branch Manager
U.S. Environmental Protection Agency
Region II
Jacob K. Javits Federal Building
New York, New York 10278

Dear Mr. Giardina:

FUSRAP-OWNED SITES - NESHAPS 1992 AIR EMISSIONS REPORTS - SUBMITTAL TO EPA REGION II

Enclosed are the Calendar Year 1992 National Emissions Standards for Hazardous Air Pollutants (NESHAPS) Annual Reports for Department of Energy (DOE) Formerly Utilized Sites Remedial Action Program (FUSRAP) sites in Region II. The enclosed reports have been prepared for your information in the spirit of a draft Memorandum of Understanding between DOE and the EPA that addresses, among several issues, the radionuclide NESHAPS requirements under 40 CFR 61, Subparts H and Q.

The annual reports were prepared based on DOE-Headquarters guidance for DOE Field Operations to fulfill the NESHAPS requirements under 40 CFR 61, Part H. Subpart H applies to operations at any facility owned or operated by DOE that may emit any radionuclides, other than radon, into the air. Radionuclide emission rates for non-radon emitters were calculated using the EPA-approved dose model CAP88-PC, as directed in 40 CFR Section 61.93.

Sites subject to Subpart H and for which annual reports have been prepared include the following six sites in Region II:

- Colonie Interim Storage Site (CISS)
- Maywood Interim Storage Site (MISS)
- Middlesex Sampling Plant (MSP)
- New Brunswick Site (NBS)
- Niagara Falls Storage Site (NFSS)
- Wayne Interim Storage Site (WISS)

The information in the annual reports has been organized by site and source for ease of review.

Subpart Q of 40 CFR 61 applies to sites that store radium-containing material. The results of radon flux monitoring for MISS, MSP, NBS, and NFSS are included within Section IV as supplemental information.

Paul A. Giardina

2

June 25, 1991

The CAP88 computer model used to prepare the 1992 annual reports was used for the first time for FUSRAP sites. The CAP88 model is more realistic than the AIRDOS computer model, which has been used for past annual reports, and places emphasis on accurate population distribution for the air dispersion modeling. If no facility modifications take place during 1993, the CAP88 results for 1993 will be virtually identical to the 1992 calculations.

Because the CAP88 calculations for CISS, MISS, MSP, NBS, NFSS, and WISS for 1993 will result in virtually the same outcome as the 1992 calculation, DOE requests a waiver from the reporting and modelling requirements of Subpart H, Sections 61.93(a) and 61.94. Should any significant facility modifications requiring an application for approval under Section 61.96(b) be performed during 1993 or any following calendar year, then the Subpart H modelling and reporting requirements would be met.

If you have any questions, please contact me or Steven K. Oldham at (615) 576-7070.

Sincerely,

William M. Seay, Acting Director
Former Sites Restoration Division

Section I. Facility Information - MISS

Site Description

The site is located in a highly developed area in the Borough of Maywood and the Township of Rochelle Park in Bergen County, New Jersey. MISS is located approximately 19 km (12 mi) north-northwest of New York City and 21 km (13 mi) northeast of Newark, New Jersey. The site consists of a woodframe building used for the storage of investigation-derived waste; a storage pile covered by an impermeable geotextile membrane that contains approximately 35,500 yd³ of low-level radioactive soil; and an office trailer. MISS is bounded by New Jersey Route 17 on the west; a railroad line on the north; and commercial/industrial areas on the south and east. Residential areas are located north of the railroad and within 274 m (300 yd) to the west. The site is a fenced lot occupying approximately 4.7 ha (11.7 acres).

MISS was established to provide interim storage for low-level radioactive soils found in the vicinity of the former Maywood Chemical Works. From 1916 through 1959, the Maywood Chemical Works processed monazite sand for industrial uses. Process wastes were placed in surface impoundments onsite. Some of these process wastes were later used as mulch and fill on nearby properties, contaminating them with radioactive thorium.

In 1954, after the enactment of the Atomic Energy Act, the Atomic Energy Commission (AEC) issued a license to the Maywood Chemical Works for the processing and manufacture of radioactive material. The Maywood Chemical Works stopped processing thorium in 1959 and shortly thereafter was sold to the Stepan Company. Based on AEC inspections and information, remedial actions were performed by the Stepan Company to consolidate some of the radioactively contaminated soil.

From 1980 to 1984, subsequent radiological surveys identified additional areas of contamination, both onsite and offsite. In 1984, DOE negotiated a lease for Stepan company land on which MISS would be established. In 1985, the land was transferred to DOE ownership and currently provides interim storage for contaminated materials removed from vicinity properties.

Based on historical weather data 1951 to 1980, the mean monthly temperature ranges from a low of -2.6°C (27.4°F) in January to a high of 22.9°C (73.2°F) in July. The mean annual precipitation is about 123.8 cm (48.3 in.). The wind blows predominantly from the southwest at approximately 16.4 km/h (10.2 mph).

Source Description

The source area consists of two small vegetative-covered areas. The total source area is 63,118 m² (687,355 ft²).

Section III. Dose Assessments - MISS

Description of Dose Model

The effective dose equivalent for a maximally exposed individual and for the collective population was calculated in a two-step process. The first step consisted of modeling the release of particulates from the site using the methodology given in EPA's "Rapid Assessment of Exposure to Particulate Emissions from Surface Contamination Sites (EPA/600/8-85/002)". The second step consisted of inputting these particulate release rates, along with local population and meteorological data, into EPA's CAP88-PC computer model.

The CAP88-PC model uses a modified Gaussian plume equation to estimate the average dispersion of radionuclides released from a site. Assessments are done for a circular grid of distances and directions for a radius of 80 km (50 mi) around the site. The location of the nearest receptor is one of the distances for which this assessment is performed. The model reports receptor dose rates based on the distances used as input parameters. These receptor dose rates are based on a continuous exposure scenario. Therefore, in reporting the dose rate to the maximally exposed individual, the computed dose rate is adjusted for an appropriate occupancy scenario.

The program computes radionuclide concentrations in air, rates of deposition on ground surfaces, concentrations in food, and intake rates to people from ingestion of food produced in the assessment area. Estimates of the radionuclide concentrations in produce, leafy vegetables, milk and meat consumed by humans, are made by coupling the output of the atmospheric transport models with the U.S. Nuclear Regulatory Commission Regulatory Guide 1.109 terrestrial food chain models. The population density used in the model was based on known land use surrounding the site and 1990 census figures. The effective dose equivalent is calculated by combining the inhalation and ingestion intake rates and the air and ground surface concentrations with dose conversion factors, using the weighting factors in the International Commission on Radiological Protection (ICRP) Publication 26.

Summary of Input Parameters

Average Annual Temperature: 13°C (55°F)

Total Annual Precipitation: 85 cm (33 in)

Wind Speed and Direction: CAP88-PC file LEA0189

Population Density: 4.97×10^4 people/m²

Location and Distance of Maximally Exposed Individual: 45 m Northeast

Maximally Exposed Individual Occupancy Factor: 22.8%

Compliance Assessment (Calculated on the basis of distance of maximally exposed individual from source and adjusted for a reasonable occupancy scenario.)

Effective Dose Equivalent of Maximally Exposed Individual: 2.17×10^{-2} mrem/yr

Section III. (continued)

Certification

I certify under penalty of law that I have personally examined and am familiar with the information submitted herein and based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate and complete. I am aware that there are significant penalties for submitting false information including the possibility of fine and imprisonment. (See, 18 U.S.C. 1001)

Section IV. Supplemental Information - MISS

This section is not required by the NESHAPs regulations as part of the annual reporting requirements. The supplemental information is included to provide information for DOE guidance development and for future interactions with EPA. The bullet format of this sections follows the guidance received from DOE-HQ for the preparation of the calendar year 1992 air emissions annual reports for DOE sites.

- o The total collective population dose is the sum of the doses from all exposure pathways. Because the only pathway with a significant potential contribution to the collective population dose is airborne contamination, the total population dose is equal to that calculated by CAP88-PC, Version 1.0, namely 7.60×10^{-2} person-rem/yr (7.60×10^{-4} person-Sv/yr). CAP88-PC output for MISS emissions in 1992 is provided in Appendix A.
- o 40 CFR Part 61 Subpart T, "National Emission Standards for Radon Emissions from the Disposal of Uranium Mill Tailings," is not applicable to FUSRAP sites. Radon flux rate information and monitoring locations demonstrating compliance with the 20 pCi/m²/s (0.74 Bq/m²/s) limit of 40 CFR Part 61 Subpart Q, "National Emission Standards for Radon Emissions from Department of Energy Facilities," is provided in Appendix B.
- o Information on Radon-220 emissions from MISS is provided in Appendix C.
- o MISS is an interim storage site with no known non-disposal/non-storage sources of Rn-222 emissions. Average annual concentrations of radon in the air for MISS are provided in Appendix D.
- o MISS is not subject to 40 CFR Part 61 Subpart H Section 61.93(b) continuous monitoring requirements.

(continued)

^a $1 \times 10^{-9} \mu\text{Ci}/\text{ml}$ is equivalent to 0.037 Bq/L and 1 pCi/L. The DOE guideline is $3.0 \times 10^{-9} \mu\text{Ci}/\text{ml}$.

^bMeasured background has not been subtracted from the fenceline and onsite readings.

^cSampling locations are shown in Figures 3-1 and 3-2.

^dQuality control for station 1.

^eQuality control for station 2.

^fLocated at the Rochelle Park Fire Station, approximately 0.8 km (0.5 mi) northwest of MISS.

^gLocated at the Rochelle Park Post Office, approximately 0.8 km (0.5 mi) northwest of MISS.

^hLocated at 100 Fair St., Paterson, N.J., approximately 8 km (0.5 mi) northwest of MISS; established on June 30, 1992.
