Attention: Mr. Michael Nannini

Subject: Maywood Site - Transmittal of Characterization Report  
and Map of JFK Park

Dear Mr. Nannini:

Enclosed is a copy of the characterization report for John F. Kennedy Park and a map summarizing the contaminant characteristics of the park as you requested in a telephone conversation with Andrea George. As we discussed in our previous meeting, the park is contaminated at low levels with the radionuclide thorium-232. Thorium-232 is an alpha emitter which means it is only a danger if ingested or inhaled in large quantities. The report explains how the contamination was transported to the park, how we determined which areas of the park are contaminated, and how concentrated the contamination is.

The map that is enclosed shows the boreholes from which we obtained radiation readings and soil samples. The map also illustrates the areas and depths in which either the soil samples or the radiation readings indicated that the thorium-232 was above the Department of Energy guideline concentration of 5 pCi/g. The thorium-232 was found either on the surface (top 6 in of soil), 2-4 ft below surface, or 4-7 ft below surface.

I hope this information is helpful. If you have any further questions, please contact Lee Woods at the Maywood Information Center at (201) 843-7466 or me directly at (615) 576-4718.

Sincerely,

*Mike Redmon*
